The Eagle ESG-Focused Corporate Bond portfolio relies on the expertise of a professional, experienced fixed-income team to seek corporate bond issuers that make positive environmental, social, and governance contributions. The portfolio objectives are stable income and total returns. With a combined 100-plus years of experience, the portfolio managers and analysts provide a wealth of bond expertise and have a track record of successfully managing fixed income through all market environments.

**INVESTMENT PROCESS**

- The process begins with a top-down look at interest-rate trends and economic data. This helps determine the portfolio target duration, yield curve positioning, industry allocation, and credit risk.
- This is followed by in-depth bottom-up credit research. The goal of this research and analysis is to maximize total return through diversified portfolios managed with a long-term strategic view.
- The team seeks to identify bonds that are underappreciated by the market and have stable-to-improving credit profiles.
- The team constructs well-diversified portfolios of these issuers that also exhibit positive environmental, social, and governance attributes.
- **ESG Integration** – ESG research is integrated throughout every level of the investment process
  - Our ESG credit team takes a qualitative and quantitative evaluation approach to evaluating the corporate bond universe. Rather than concentrating on a bond’s “use of proceeds” specific to a particular issuance (i.e., Green Bonds), we evaluate the credit obligor as a whole to assess if the organization is implementing sustainable business practices and appropriate governance.
  - We do not exclude any industry as a whole but allow ourselves to invest in the best in class or in companies we determine are moving toward implementing positive business decisions from an ESG perspective.
  - Corporate ESG data is generally not standardized and companies provide ESG-related data in various forms, if at all. In addition to evaluating bond offering statements, quarterly and annual reports, and company published sustainability reports, we utilize Bloomberg provided data based on third-party research such as RobecoSAM, Sustainalytics, and Carbon Disclosure Project as well as Bloomberg’s proprietary analysis.
  - The materiality of specific ESG factors on the financial performance of a company can vary by industry.
  - ESG analysis is an integrated component to our current fundamental credit research process. Thus, both the ESG analysis and fundamental credit research are factored into our overall assessment before we make a buy, sell, hold decision.
Not every investment opportunity will meet all of the stringent investment criteria mentioned to the same degree. Trade-offs must be made, which is where experience and judgment play a key role. Accounts are invested at the discretion of the portfolio manager and may take up to 60 days to become fully invested.

Performance Disclosures

Income earned from investments in municipal bonds, while exempt from federal taxes, may be subject to state and local income taxes. All capital gains, as well as income earned from other sources, are subject to taxation. Income from municipal securities may also be subject to the Alternative Minimum Tax. Municipal securities typically provide a lower yield than comparably rated taxable investments in consideration of their tax-advantaged status. Investments in municipal securities may not be appropriate for all investors, particularly those who do not stand to benefit from the tax status of the investment. Please consult an income-tax professional to assess the impact of holding such securities on your tax liability.

Past performance does not guarantee or indicate future results. No inference should be drawn by present or prospective clients that managed accounts will achieve similar performance in the future. Investment in a portfolio, investment manager or security should not be based on past performance alone. Because accounts are individually managed, returns for separate accounts may be higher or lower than the average performance stated. Individual portfolio/ performance results may vary due to market conditions, trading costs and certain other factors, which may be unique to each account. There is no guarantee that these investment strategies will work under all market conditions, and each investor should evaluate their ability to invest for the long term, especially during periods of downturn in the market. Investing involves risk and you may incur a profit or a loss. Investment returns and principal value will fluctuate so that an investor’s portfolio, when redeemed, may be worth more or less than their original cost. Diversification does not ensure a profit or guarantee against a loss.

Descriptions and Definitions

The Bloomberg Barclays Intermediate Corp Index, publicly issued U.S. corporate and specified foreign debentures and secured notes that meet the specified maturity, liquidity, and quality requirements. To qualify, bonds must be SEC-registered. Indices are unmanaged and one cannot invest directly in the index.

Duration - is a measure of the average life of a bond, weighting each repayment by the time until it will be made and reflecting the fact that money flows in the near future are more valuable than the same money flows at a later date. Duration indicates how changes in interest rates will affect the price of a bond (or bond portfolio). The longer the duration of a bond, the greater the extent to which its price is affected by interest rate changes. As such, duration is used as a measure of risk for bond portfolios.

Maturity - The date on which a loan or bond comes due and is to be paid off.

Yield to maturity - The yield of a bond to maturity takes into account the price discount from or premium over the face amount. It is greater than the current yield when the bond is selling at a discount and less than the current yield when the bond is selling at a premium.

Risks Associated with Fixed Income Investing

Historically, bonds have indeed provided less volatility and less risk of loss of capital than has equity investing. However, there are many factors which may affect the risk and return profile of a fixed-income portfolio. The two most prominent factors are interest-rate movements and the creditworthiness of the bond issuer. The risk of a change in the market value of the investment due to changes in interest rates is known as interest-rate risk. Interest-rate risk is subject to many variables but may be analyzed based on various data (e.g., effective duration). The risk that the issuer may default on interest and/or principal payments is often referred to as credit risk. Credit risk is typically measured by ratings issued by ratings agencies such as Moody’s and Standard & Poor’s. Bonds issued by the U.S. Government have significantly less risk of default than those issued by corporations and municipalities (see below for a discussion of the risk associated with convertible securities). However, the overall return on Government bonds tends to be less than these other types of fixed-income securities. Finally, reinvestment risk is the possibility that the proceeds of a maturing investment must be invested in a lower-yielding security, all other things held constant, due to changes in the interest-rate environment. Investors should pay careful attention to the types of fixed-income securities which comprise their portfolio, and remember that, as with all investments, there is the risk of the loss of capital.

The investment strategy will include only holdings deemed consistent with the applicable Environmental Social Governance (ESG) guidelines. As a result, the universe of investments available to the strategy will be more limited than strategies not applying such guidelines, which may cause it to perform differently than similar strategies that do not have such a policy.
